

## ~~Sorting~~

→ Process of arranging items systematically.

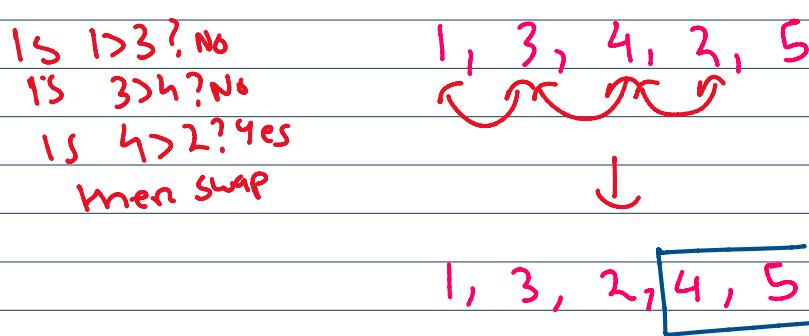

## ~~Bubble Sort~~

→ It is the simplest sorting algo. It works by repeatedly comparing 2 adjacent elements & swapping them if they are in the wrong order.

With the 1st pass, the largest element comes at the end of the array.

First Pass

With 2nd Pass,  
2nd Largest element comes at the second last index.

Second Pass

), don't need to compare again as they are already sorted

1 < 1 > 3? No      1. 2. 1. 4. 5

Is  $i > 3$ ? No  
Is  $j > 2$ ? Yes  
Then swap

1, 3, 2, 4, 5

↓

1, 2, 3, 4, 5

Third Pass

Sorted Array!!

Bubble Sort also known as: Sinking Sort or Exchange Sort

↗ In Depth Working of Bubble Sort

$i = 0$

1<sup>st</sup> pass

Is  $j > j-1$ ? No  
Then swap

Is  $j > j-1$ ? Yes  
Is  $j > j-1$ ? No  
Then swap

Is  $j > j-1$ ? No  
Then swap

1, 3, 4, 2, 5

$j$  is an internal loop which runs  $n-1$  times

'i' here only acts as a counter which keeps on increasing

$i = 1$

Is  $j > j-1$ ? Yes  
Is  $j > j-1$ ? Yes  
Is  $j > j-1$ ? No  
Then swap

1, 3, 4, 2, 5

0 1 2 3 4 5  
1, 3, 2, 4, 5

It doesn't make a sense to get 'j' here bcoz its already sorted

its already sorted

Thus 'j' basically runs till  $\leq \text{length} - i - 1$

$$i \text{ 2nd pass} \Rightarrow 5 - 1 - 1$$

$\Rightarrow 5$

So 'j' only runs till  
3rd index

$$i = 2$$

3rd pass

1, 3, 2,

4, 5

j only checks  
this bcoz

→ already  
sorted

j only runs till

$$\leq \text{length} - i - 1$$

$$= 5 - 2 - 1$$

$$= 2$$

Is  $j > j-1$ ? Yes 1, 3, 2, 4, 5

Is  $j > j-1$ ? No

Then swap

j

↓  
1, 2, [3, 4, 5]

only till  
2nd index

~~Complexity~~

Space Complexity:  $O(1)$  / constant

→ No extra space is needed here eg. Copying of array etc.

→ Also known as Inplace Sorting Algorithms.

Time Complexity: Best Case :  $O(N) \Rightarrow$  Sorted array

Worst Case :  $O(N^2) \Rightarrow$  Sorted in  
descending  
order

→ As the size of array grows, no. of Comparisons also grow.

~~Best Case~~ → Array is Sorted

~~Best Case~~ → Array is Sorted

$i = 0$   
first  
pass

$j$  + + + +  
1, 2, 3, 4, 5

→ Run only once  
Don't check it  
again

Note: When ' $j$ ' never swaps for the value of ' $i$ ', it means that array is sorted. Thus, you can end the program.

~~Best Case Comparisons :  $N - 1 \Rightarrow N$~~

We ignore constants in T.C bcz we need to find a relationship i.e mathematical equation

Best Case:  $O(N)$

~~Worst Case~~

$i = 0$   
1<sup>st</sup> pass

$j$   
5, 4, 3, 2, 1  
 $j$  ↓  
4, 5, 3, 2, 1  
 $j$   
4, 3, 5, 2, 1  
 $j$   
4, 3, 2, 5, 1  
 $j$   
4, 3, 2, 1, 5       $(N-1)$  Swaps

$i = 1$   
2<sup>nd</sup> pass

Run  
loop  
only  
for this

$j$   
4, 3, 2, 1, [5]

→ Sorted

3, 4, 3, 1, 5

↓      ↓  
3, 3, 4, 1, 5

↓      3, 2, 1, 4, 5      ( $N-2$ ) swaps

$i = 2$

3<sup>rd</sup> pass

3, 1, 1, 4, 5

↓      ↓  
3, 3, 1, 4, 5

↓      2, 1, 3, 4, 5      ( $N-3$ ) swaps

$i = 3$

4<sup>th</sup> pass

3, 1, 3, 4, 5

1, 3, 3, 4, 5

( $N-4$ ) swaps

Sorted Array !!

$$\begin{aligned}
 \text{total comparisons} &= N-1 + N-2 + N-3 + N-4 \\
 &= 4N - (1+2+3+4) \\
 &= 4N - \left[ \frac{N \times (N+1)}{2} \right] \\
 &= 4N - \frac{N^2+N}{2} \\
 &= O\left(\frac{7N - N^2}{2}\right)
 \end{aligned}$$

total comparisons =  $O(N^2)$

↳ In time complexity, constant & less dominating terms are ignored.

Worst Case :  $O(N^2)$

↗ Stability

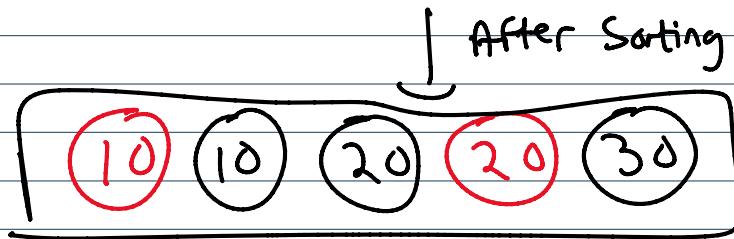

↓ After Sorting

Before Sorting: Elements in white were before (in case of 10)  
 ↗ Elements of Red were before (in case of 30)

After Sorting: Same order is maintained

Thus, this is called Stable Sort

=> unstable  
since  
order  
isn't maintained
